American Express

Dear American Express Hiring Team,

I am excited to apply for the Summer Data Analytics Intern position within the US Consumer Services team. I am currently pursuing a master's degree in Data Science at Columbia University, with an expected graduation date of December 2027, after working across operations, consulting, and analytics.

Throughout my career, I have consistently been drawn to the same kind of work: using data to understand a problem, building a more efficient way to analyze it, and helping a team decide what to do next.

My career began in operational roles at Samsung and Peloton, where I automated recurring processes, analyzed large business datasets, and built dashboards for decision-makers. At BCG, I moved closer to structured problem-solving, using market and financial analysis to help clients evaluate complex strategic questions. Most recently, at Shopee, I combined both sides of that experience by analyzing seller and campaign performance while building automated Python and SQL pipelines behind the reporting. With each role, I found myself wanting to spend more time on the technical work underlying the recommendation.

That realization led me to pursue Data Science at Columbia. I wanted the technical foundation to move beyond reporting what happened and become better equipped to build models, test ideas, and create systems that can support better decisions. Alongside my coursework, I have worked as a Research Assistant implementing and evaluating deep learning models and as a Graduate Teaching Assistant explaining technical concepts to students. These experiences have confirmed that Data Science is the direction in which I want to build my career: it combines the analytical problem-solving I enjoyed in my previous roles with the opportunity to develop the tools and methods behind the answer.

The American Express internship would be a natural next step in that journey. It would allow me to apply my business experience and growing technical skills to customer-focused questions while learning from a team that uses analytics to shape real products and decisions. I would welcome the opportunity to contribute my perspective to American Express and continue developing as a data scientist.

Sincerely,
Morgan Le
