Bain & Company

Dear Bain AI, Insights & Solutions Hiring Team,

I am excited to apply for the AI Engineering Intern position for Summer 2027. I am currently pursuing a master's degree in Data Science at Columbia University after working across consulting, operations, and analytics. In those roles, I enjoyed working with stakeholders, breaking down unclear business problems, and using data to figure out what to do next. At the same time, I found myself wanting to go further into the technical side and actually build the systems behind those solutions. That is what led me to pursue Data Science at Columbia, and why Bain AIS is especially interesting to me.

Most recently, as a Research Assistant at Vietnam National University, I fine-tuned and evaluated deep learning models in PyTorch and built Python workflows for geospatial feature engineering, training, and evaluation. The work gave me more hands-on experience with how machine learning systems are developed and tested in practice. I have also spent a lot of time building outside of research through independent projects and hackathons. For the OpenAI-sponsored WebMCP Challenge, I developed Dwellwise, an apartment planning application that lets AI agents interact directly with a 3D design environment. Building it gave me experience working with tool calls, application state, and human confirmation for higher-risk actions.

Before moving deeper into technical work, I spent several years in client-facing and operating roles. At BCG, I worked with cross-functional client teams on data-driven analysis for a \$10 billion infrastructure initiative. At Shopee, I worked much closer to day-to-day execution, building automated data pipelines that reduced manual processing time by 20% while coordinating service delivery across more than 10 internal staff and BPO partners. These roles taught me how to work with different stakeholders, understand what the actual problem is, and make sure the work is useful beyond the analysis itself.

Bain AIS stands out to me because it sits at the intersection of the work I have done and the direction I want to keep moving toward. I enjoy customer-facing problem solving, but I also want to be directly involved in building and implementing the technical solution. I believe my background in consulting and operations, together with my growing experience in machine learning and AI engineering, would allow me to contribute well to that kind of team.

Sincerely,
Morgan Le
