Central Insurance

Dear Hiring Manager,

I am excited to apply for the Data Engineering Intern position at Central Insurance. I am currently pursuing a master's degree in Data Science at Columbia University. Before Columbia, my career spanned analytics, operations, and consulting, and I consistently found myself drawn to the technical side of the problems I was solving: automating repetitive processes, building data pipelines, and creating tools that helped teams work more effectively. These experiences led me to pursue graduate study and continue developing toward a career in data engineering.

Most recently, at Shopee, I engineered automated Python and SQL pipelines that consolidated sales and P&L data from multiple sources, reducing manual processing time by 20%. The resulting data supported analysis of seller performance, campaign effectiveness, and regional sales trends used to inform business decisions. Alongside this technical work, I coordinated day-to-day service delivery across a regional team of more than 10 internal personnel and BPO partners. That combination taught me to understand both how data systems operate and how the people relying on them use their outputs to make decisions.

Earlier, at Samsung Electronics America, I supported procurement operations involving more than \$1 million in daily purchasing volume across over 100 global material supply chains. I automated purchase-order tracking and reporting workflows and improved Excel-based tools, increasing analyst productivity by 10%. I have continued building my technical skills through research and independent projects. At Vietnam National University, I developed Python preprocessing workflows for geospatial feature engineering, model training, and evaluation. I also built a FastAPI and PostgreSQL backend for an AI-powered air-quality platform that integrated information from multiple data sources and maintained auditable investigation histories.

Central Insurance particularly appeals to me because its internship combines meaningful project ownership with mentorship, continuous learning, and exposure to how data engineering supports the broader business. I would value the opportunity to learn from senior engineers, contribute within established development patterns, and carry a summer-long project from implementation through presentation to executive leaders. I believe my experience with Python, SQL, PostgreSQL, automated pipelines, and cross-functional operations would allow me to contribute effectively while continuing to grow as a data engineer.

Sincerely,
Morgan Le
