Deutsche Bank
New York, NY

Dear Technology, Data and Innovation Hiring Team,

I am excited to apply for Deutsche Bank's 2027 Technology, Data and Innovation Analyst Internship Program in New York. I am currently pursuing a master's degree in Data Science at Columbia University after working across analytics, operations, and consulting. In each of those roles, I was most energized when I could move beyond analyzing a problem to build the pipeline, model, or tool that helped solve it. Deutsche Bank's focus on strengthening engineering, modernizing infrastructure, and applying AI to complex financial problems closely matches the kind of work I hope to pursue.

Most recently, as a Research Assistant at Vietnam National University, I implemented and fine-tuned deep learning models in PyTorch, benchmarked their performance on Vietnam-scale datasets, and developed Python workflows for geospatial feature engineering, training, and evaluation. I have continued building hands-on engineering experience through independent projects. For ZephyrAQ, an AI-powered air-quality investigation platform, I developed a FastAPI and PostgreSQL backend that integrated data from multiple sources and supported human review and auditable investigation histories. For Dwellwise, I built an agent-ready apartment planner with validated application commands, revision checks, and human confirmation for destructive actions. These projects strengthened both my ability to build end-to-end systems and my judgment about using AI responsibly.

My earlier roles taught me how to connect technical work to business outcomes and collaborate across functions. At Shopee, I engineered automated Python and SQL pipelines that consolidated sales and P&L data from multiple sources, reducing manual processing time by 20%, while coordinating service delivery across a regional team of more than 10 internal personnel and BPO partners. At BCG, I worked with cross-functional client teams to translate business questions into data-driven analyses for a \$10 billion infrastructure initiative. Together, these experiences taught me to communicate clearly, adapt quickly, and keep technical work focused on the needs of the people and decisions it supports.

I am particularly drawn to TDI because the program combines hands-on development, exposure to cloud and AI technologies, and learning within collaborative delivery teams. I would welcome the opportunity to contribute my experience in Python, machine learning, data pipelines, and stakeholder-centered problem solving while learning how Deutsche Bank engineers secure, resilient technology at global scale. Thank you for your consideration.

Sincerely,

Morgan Le
