Domino Data Lab

Dear Domino Hiring Team,

I am excited to apply for the Forward Deployed Engineer Intern position at Domino. I am pursuing a master's degree in Data Science at Columbia University after working across consulting, operations, and analytics. That experience taught me to work directly with stakeholders, structure ambiguous business problems, and turn them into actionable solutions. I found the work most compelling when I could pair that understanding with technical implementation, which is what draws me to forward deployed engineering.

My roles have required me to move between users, business problems, and technical execution. At BCG, I worked with client teams to structure complex strategic questions and translate them into data-driven analysis for a \$10 billion real estate infrastructure initiative. At Shopee, I built and automated Python and SQL pipelines for sales and P&L reporting and an internal subscriber workflow, reducing processing time by 20%. These experiences taught me how important it is to understand both the technical problem and the people who ultimately need to use the solution.

I have increasingly moved toward building those solutions myself. Through hackathons and independent projects, I have built end-to-end applications involving APIs, databases, data pipelines, cloud infrastructure, machine learning models, and AI agents. I enjoy the process of starting with an unclear problem, understanding what a user actually needs, and then iterating quickly until the technical solution works in practice. At Columbia, I am now deepening the computer science, data engineering, and machine learning foundations behind that work.

What appeals to me most about Domino is the opportunity to combine customer collaboration with hands-on engineering across model development, deployment, and governance. I would welcome the opportunity to bring my customer-facing experience, Python and machine learning background, and enthusiasm for building trustworthy AI systems for complex, regulated environments.

Sincerely,

Morgan Le
